

*Enhance comfort,  
reduce anxiety.*

A new, gentle, drill-free procedure is now available in our office. It's the **PrepStart™** Air Abrasion System which will increase your comfort and reduce anxiety during cavity preparation and other dental procedures. With the **PrepStart™** Air abrasion system, you'll spend much less time in the dental chair. Procedures are so gentle -- and anesthesia is seldom required -- it's possible to treat several teeth in one visit rather than having to schedule additional appointments. Since we're able to treat almost all our young patients with a new level of comfort without the need for even a mild anesthetic shot, childhood anxiety about trips to the dentist can now be dealt with effectively.

# Relax,

This office has a **PrepStart™** Air Abrasion System.

# Relax,

# Relax,

*The wait is over.*

*No dental  
drill.  
No shot,  
treatment  
time reduced.*

Cavity treatment has changed. Air abrasion is the breakthrough alternative to the drill. It's the gentle, drill-free technology which makes it possible to treat many cavities quickly and effectively without anesthesia.

*What  
you'll feel.*

Most patients, in fact, experience no unpleasant sensation and no pain. Without the heat and vibration of the drill, **PrepStart™** air abrasion eliminates the major discomforts associated with cavity preparation. Because air abrasion is so gentle on tooth enamel, the possibility of microfracturing or chipping is also eliminated.

*Completely  
safe.*

The microscopic size particles used in the **PrepStart™** Air Abrasion System have long been used in medicine and food. Completely safe, the pure alumina oxide particles are biocompatible and similar to those found in toothpaste whiteners.

*Now there's a unique,  
gentle way to treat most  
cavities.*

The **PrepStart™** Air Abrasion System produces a gentle air stream of microabrasive particles, delivered through a small handpiece, that quickly and gently smooth away decay. The handpiece actually never makes direct contact with the tooth. Not only does the precision of air abrasion allow more healthy tooth structure to be conserved, it's now possible to treat decay at its earliest stages before more serious problems develop. Ideal for both restorative and cosmetic

procedures, **PrepStart™** quickly and comfortably prepares surfaces for composite resin fillings and is highly effective for cosmetic procedures such as veneers. It is also used for the removal of superficial discoloration, porcelain repair and in the application of preventive sealants in just seconds.

*Drill-free, shot-free dentistry.*
